Corner Grocer Project Documentation

This program helps Corner Grocer track how often produce items are purchased during the day. When the program starts, it reads CS210_Project_Three_Input_File.txt, counts each item, and automatically creates frequency.dat as a backup file. The main design uses one class named GroceryTracker. The private section stores item counts in a map, and the public functions load the file, create the backup, search for one item, print all frequencies, and print the histogram. This keeps main.cpp simple and makes the program easier to read and update. The menu lets the user search for one item, view all item totals, view a histogram, or exit. Basic input validation helps prevent crashes if the user enters an invalid menu choice. Comments are included in the code to explain the main steps.

Example:

```
Corner Grocer Item Tracker

1. Search for an item
2. Print all item frequencies
3. Print item histogram
4. Exit

Enter your choice: 1

Enter the item name: Cranberries

Cranberries appears 10 time(s).

Enter your choice: 3

Cranberries *****
Zucchini *****
```
